Recommendations for selection

Only basic selection parameters are included. To make the very best selection of a ball screw, the designer should specify such critical parameters as the load profile, the linear or rotational speed, the rates of acceleration and deceleration, the cycle rate, the environment, the required life, the lead accuracy, the stiffness, and any other special requirement. If in doubt, please consult an SKF ball screw specialist before placing an order.

Basic dynamic load rating (C_a)

The dynamic rating is used to compute the fatigue life of ball screws. It is the axial load constant in magnitude and direction, and acting centrally under which the nominal life (as defined by ISO) reaches one million revolutions.

Nominal fatigue life L_{10}

The nominal life of a ball screw is the number of revolutions (or the number of operating hours at a given constant speed) which the ball screw is capable of enduring before the first sign of fatigue (flaking, spalling) occurs on one of the rolling surfaces.

It is however evident from both laboratory tests and practical experience that seemingly identical ball screws operating under identical conditions have different lives, hence the notion of *nominal life*.

It is, in accordance with ISO definition, the life achieved or exceeded by 90 % of a sufficiently large group of apparently identical ball screws, working in identical conditions (alignment, axial and centrally applied load, speed, acceleration, lubrication, temperature and cleanliness).

Service life

The actual life achieved by a specific ball screw before it fails is known as “service life”. Failure is not only by fatigue (flaking or spalling); but also by inadequate lubrication and wear; wear of the recirculation system, corrosion, contamination, and, more generally, by loss of the functional characteristics required by the application. Experience acquired with similar applications will help to select the proper screw to obtain the required service life. One must also take into account structural requirements such as the strength of screw ends and nut attachments, due to the loads applied on these elements in service. To attain L_{10} life performance a mean working load of up to 80 % of C_a and a stroke higher than 4 leads are permitted.

Life test bench

(1) SKF can help you to define this value in relation with the actual conditions of service.

Equivalent dynamic loads

The loads acting on the screw can be calculated according to the laws of mechanics if the external forces (e.g. power transmission, work, rotary and linear inertia forces) are known or can be calculated. It is necessary to calculate the equivalent dynamic load.

Radial and moment loads must be taken by linear bearing systems. It is extremely important to resolve these problems at the earliest conceptual stage. These forces are detrimental to the life and the expected performance of the screw.

Fluctuating load

When the load fluctuates during the working cycle, it is necessary to calculate the equivalent dynamic load: this load is defined as that hypothetical load, constant in magnitude and direction, acting axially and centrally on the screw which, if applied, would have the same influence on the screw life as the actual loads to which the screw is subjected.

Additional loads due, for example to misalignment, uneven loading, shocks, and so on, must be taken in account.

Their influence on the nominal life of the screw is generally taken care of, consult SKF for advice.

Static load carrying capacity (C_{0a})

Ball screws should be selected on the basis of the basic static load rating C_{0a} instead of on bearing life when they are submitted to continuous or intermittent shock loads, while stationary or rotating at very low speed for short duration. The permissible load is determined by the permanent deformation caused by the load acting at the contact points.

It is defined by ISO standards as the purely axially and centrally applied static load which will create, by calculation, a total (rolling element + thread surface) permanent deformation equal to 0.0001 of the diameter of the rolling element.

A ball screw must be selected by its basic static load rating which must be, at least, equal to the product of the maximum axial static load applied and a safety factor " s_0 ".

The safety factor is selected in relation with past experience of similar applications and requirements of running smoothness and noise level (1).

Critical rotating speed for screw shafts

The shaft is equated to a cylinder, the diameter of which is the root diameter of the thread. The formulas use a parameter the value of which is dictated by the mounting of the screw shaft (whether it is simply supported or fixed).

As a rule the nut is not considered as a support of the screw shaft. Because of the potential inaccuracies in the mounting of the screw assembly, a safety factor of 0.80 is applied to the calculated critical speeds.

Calculations which consider the nut as a support of the shaft, or reduce the safety factor, require practical tests and possibly an optimization of the design (1).

(1) SKF can help you to define this value in relation with the actual conditions of service.

Permissible speed limit

The permissible speed limit is that speed which a screw cannot reliably exceed at any time. It is generally the limiting speed of the recirculation system in the nut. It is expressed as the product of the rpm and the nominal diameter of the screw shaft (in mm).

The speed limits quoted in this catalogue are the maximum speeds that may be applied through very short periods and in optimized running conditions of alignment, light external load and preload with monitored lubrication.

Running a screw continuously at the permissible speed limit may lead to a reduction of the calculated life of the nut mechanism.

High speed associated with high load requires a large input torque and yields a relatively short nominal life (1).

In the case of high acceleration and deceleration, it is recommended to either work under a nominal external load or to apply a light preload to the nut to avoid internal sliding during reversal.

The value of preload of screws submitted to high velocity must be that preload which ensures that the rolling elements do not slide (1).

Too high a preload will create unacceptable increases of the internal temperature.

Lubrication

The lubrication of screws rotating at high speed must be properly considered in quantity and quality.

The volume, spread and frequency of the application of the lubricant (oil or grease) must be properly selected and monitored. At high speed the lubricant spread on the surface of the screw shaft may be thrown off by centrifugal forces. It is important to monitor this phenomenon during the first run at high speed and possibly adapt the frequency of relubrication or the flow of lubricant, or select a lubricant with a different viscosity.

Monitoring the steady temperature reached by the nut permits the frequency of relubrication or the oil flow rate to be optimized.

Efficiency and back-driving

The performance of a screw is mainly dependant on the geometry of the contact surfaces and their finish as well as the helix angle of the thread. It is, also, dependant on the working conditions of the screw (load, speed, lubrication, preload, alignment, etc...).

The "direct efficiency" is used to define the input torque required to transform the rotation of one member into the translation of the other. Conversely, the "indirect efficiency" is used to define the axial load required to transform the translation of one member into the rotation of the other one. It is used, also, to define the braking torque required to prevent that rotation.

It is safe to consider that these screws are reversible or back-driveable under almost all circumstances.

It is therefore necessary to design a brake mechanism if backdriving is to be avoided (gear reducers or brake).

(1) SKF can help you to define this value in relation with the actual conditions of service.

Preload torque:

Internally preloaded screws exhibit a torque due to this preload. This persists even when they are not externally loaded. Preload torque is measured when assembly is lubricated with ISO grade 64 oil.

Starting torque:

This is defined as the torque needed to overcome the following to start rotation:

a) the total inertia of all moving parts accelerated by the energy source (including rotation and linear movement).

b) the internal friction of the screw/nut assembly, bearing and associated guiding devices.

In general, torque to overcome inertia (a) is greater than friction torque (b).

The coefficient of friction of the high efficiency screw when starting μ_s is estimated at up to double the dynamic coefficient μ , under normal conditions of use.

Axial play and preload

Preloaded nuts are subject to much less elastic deformation than non-preloaded nuts. Therefore they should be used whenever the accuracy of positioning under load is important.

Preload is that force applied to a set of two half nuts to either press them together or push them apart with the purpose of eliminating backlash or increasing the rigidity or stiffness of the assembly. The preload is defined by the value of the preload torque (see under that heading in the previous paragraph). The torque depends on the type of nut and on the mode of preload (elastic or rigid).

Static axial stiffness of a complete assembly

It is the ratio of the external axial load applied to the system and the axial displacement of the face of the nut in relation with the fixed (anchored) end of the screw shaft. The inverse of the *rigidity of the total system* is equal to the sum of all the inverses of the rigidity of each of the components (screw shaft, nut as mounted on the shaft, supporting bearing, supporting housings, etc...).

Because of this, the rigidity of the total system is always less than the smallest individual rigidity.

Nut rigidity

When a preload is applied to a nut, firstly, the internal play is eliminated, then, the Hertzian elastic deformation increases as the preload is applied so that the overall rigidity increases.

The theoretical deformation does not take into account machining inaccuracies, actual sharing of the load between the different contact surfaces, the elasticity of the nut and of the screw shaft. The practical stiffness values given in the catalogue are lower than the theoretical values for this reason. The rigidity values given in the SKF ball screw catalogue are individual practical values for the assembled nut.

They are determined by SKF based on the value of the selected basic preload and an external load equal to twice this preload.

Elastic deformation of screw shaft

This deformation is proportional to its length and inversely proportional to the square of the root diameter.

According to the relative importance of the screw deformation (see rigidity of the total system), too large an increase in the preload of the nut and supporting bearings yields a limited increase of rigidity and notably increases the preload torque and therefore the running temperature.

Consequently, the preload stated in the catalogue for each dimension is optimum and should not be increased.

Screw shaft buckling

The column loading of the screw shaft must be checked when it is submitted to compression loading (whether dynamically or statically).

The maximum permissible compressive load is calculated using the Euler formulas. It is then multiplied by a safety factor of 3 to 5, depending on the application.

The type of end mounting of the shaft is critical to select the proper coefficients to be used in the Euler formulas.

When the screw shaft comprises a single diameter, the root diameter is used for the calculation. When the screw comprises different sections with various diameters, calculations become more complex (1).

(1) SKF can help you to define this value in relation with the actual conditions of service.

Manufacturing precision

Generally speaking, the precision indication given in the designation defines the lead precisions see page 12 - lead precision according to ISO - (ex. G5 - G7...).

Parameters other than lead precision correspond to our internal standards (generally based on ISO "class 7").

If you require special tolerances (for example class 5) please specify when requesting a quotation or ordering.

Materials and heat treatments

Standard screw shafts are machined from steel which is surface hardened by induction (42CrMo4-NF EN10083-1 for diameters > 20 mm and 2C45 for diameters ≤ 20 mm).

Standard nuts are machined in steel which is through hardened (100 Cr6 - NFA 35.565 or equivalent for diameters ≥ 20 mm and carbon steel for diameters < 20 mm). Hardness of the contact surfaces is 56-60 HRc, depending on diameter, for standard screws.

Most assemblies made of stainless material have a surface hardness in the range 42 to 58 HRc, depending on the type. The load rating of the catalogue are given only for standard screws.

Number of circuits of balls

A nut is defined by the number of ball turns which support the load.

The number is changing, according to the product and the combination diameter/lead.

It is defined by the number of circuits and their type.

Recirculation inserts

The standard products have been fitted with composite ball recirculation inserts.

System performance is improved because of the smoother ball recirculation. This results from the improved precision of the moulded insert when compared to the former steel insert. If the product is used in severe applications, or the insert is used to prevent collapse (especially in vertical applications), a steel version is available. In such cases, the specifier should consult SKF Linear Motion to obtain the optimum solution.

Working environment

Our products have not been developed for use in an explosive atmosphere, consequently we cannot take any responsibility for the use in this field.

NOTE: 42 CrMo4, an AFNOR reference is similar to AISI 4140; 100Cr6 is similar to AISI 52100.

(1) SKF can help you to define this value in relation with the actual conditions of service.

Recommended assembly procedure

Ball screws are precision components and should be handled with care to avoid shocks. When stored out of the shipping crate they must lie on wooden or plastic vee blocks and should not be allowed to sag. Screw assemblies are shipped, wrapped in a heavy gauge plastic tube which protects them from foreign material and possible pollution. They should stay wrapped until they are used.

Radial and moment loads

Any radial or moment load on the nut will overload some of the contact surfaces, thus significantly reducing life (fig. 1).

Alignment

SKF linear guidance components should be used to ensure correct alignment and avoid non-axial loading. The parallelism of the screw shaft with the guiding devices must be checked. If external linear guidance proves impractical, we suggest mounting the nut on trunnions or gimbals and the screw shaft in self-aligning bearings.

Mounting the screw in tension helps align it properly and eliminates buckling.

Lubrication

Good lubrication is essential for the proper functioning of the screw and for its long term reliability (1).

Before shipping, the screw is coated with a protective fluid that dries to a film. *This protective film is not a lubricant.*

Depending on the selected lubricant, it may be necessary to remove this film before applying the lubricant (there may be a risk of non-compatibility).

If this operation is performed in a potentially polluted atmosphere it is highly recommended to proceed with a thorough cleaning of the assembly.

Designing the screw shaft ends

Generally speaking, when the ends of the screw shaft are specified by the customer's engineering personnel, it is their responsibility to check the strength of these ends. However, we offer in pages 36 to 39 of this catalogue, a choice of standard machined ends. As far as possible, we recommend their use.

Whatever your choice may be, please keep in mind that no dimension on the shaft ends can exceed d_0 (otherwise traces of the root of thread will appear or the shaft must be made by joining 2 pieces).

A minimum shoulder should be sufficient to maintain the internal bearing.

Operating temperature

Screws made from standard steel (see page 9) and operating under normal loads can sustain temperatures in the range $-20\text{ }^{\circ}\text{C}$ to $+110\text{ }^{\circ}\text{C}$.

Between $+110\text{ }^{\circ}\text{C}$ and $+130\text{ }^{\circ}\text{C}$, SKF must be notified so that it adapts the annealing procedure and checks that the application can be successful with a hardness below the standard minimum value (see page 9).

Above $+130\text{ }^{\circ}\text{C}$, steels adapted to the temperature of the application should be selected (100Cr6, special steel, etc...).

Consult SKF for advice.

Operating at high temperature will lower the hardness of the steel, alter the accuracy of the thread and may increase the oxidability of the materials or change lubricant properties.

fig. 1

fig. 2

(1) SKF can help you to define this value in relation with the actual conditions of service.

Separating the nut from the screw shaft

Never screw the nut off the shaft without a mandrel to prevent the balls coming out (fig. 1).

1. Remove the retaining strap
2. Hold the sleeve against the ball track (a). If the sleeve does not go over the diameter next to the ball track, adhesive tape can be used (b) or the sleeve held against the unmachined end (c). (fig. 2)
3. Without forcing, engage the nut in the screw thread.

Starting-up the screw

After the assembly has been cleaned, mounted and lubricated, it is recommended that the nut is allowed to make several full strokes at low speed; to check the proper positioning of the limit switches or reversing mechanism before applying the full load and the full speed.

NOTE:

Instructions for most operations like mounting a nut on a screw shaft, a wiper on a nut, etc... are available in separate sheets delivered with the product: please refer to them.

SKF Transrol
MOUNTING INSTRUCTIONS - BALL SCREWS

1 - Unpacking & storing

- The nut should never be separated from the screw shaft without using a sleeve. If you receive a nut on a sleeve, don't put the plastic fixation before final assembly.
- The location must be chosen so that the components will not be exposed to dirt, shocks, humidity and other detrimental actions.
- The screw assemblies should be stacked horizontally placed on 2 blocks made of hard plastic or light metal alloy on the screw thread or, when the assembly is short, the bearing seats should rest in the fit. Do not allow the screw assembly to be supported on a steel solely by the nut body.
- Before shipping, the screw is coated with a protective fluid that dries to a film. This protective film, called Quaders, is not a lubricant. Depending on the selected lubricant, it is necessary to remove this film before applying the lubricant (there may be a risk of incompatibility). If this operation is performed in a potentially polluting atmosphere, it is highly recommended to proceed with a thorough cleaning of the assembly.

2 - Preparing screw for mounting

2.1 - Nut mounted on the shaft.

As far as possible, don't remove the nut, especially for pre-machined nuts.
If you need to remove it, i.e. for end machining, check the nut orientation before dismounting, and use a sleeve.

2.2 - Nut on a sleeve, screw shaft ends already machined.

- Clean the nut and the screw shaft with a good solvent (see fig. n° 7).
- Install the wiper on the nut (see fig. n° 2A - 2B - 2C - 2D).
- Install the nut on the screw shaft (note care of the nut orientation) (see fig. n° 3A); in case of a long lead SL, see fig. n° 2B.

2.3 - Nut on sleeve - screw shafts with ends not yet machined.

- Machining the shaft ends: standard screw shafts are made of steel which is surface hardened (58 to 60 HRC). It may be useful to anneal the shaft to do this operation.
- Continue as indicated in 2.2.

3 - Lubrication

Good lubrication is essential for the proper functioning of the screw and for its long term reliability. Don't hesitate to ask for advice to be sure to use our products in the best possible conditions.

4 - Mounting the screw assembly on the machine

- Check that the end bearings and the guidance devices are aligned with the shaft.
- Check stroke and limit switches. The screw assembly should be driven back and forth a couple of times under low speed (< 50 rpm) and light load (not to exceed 5% of the dynamic rating).

Lead precision according to ISO

Lead precision is measured at 20 °C on the useful stroke l_u , which is the threaded length decreased, at each end, by the length l_e equal to the screw shaft diameter.

V_{300p} μm	G5 23			G7 35			G9 87

(5000) - 6000	170	119	390	210	960	530			

Lead accuracy control on a complete assembly

- l_u = useful travel
- l_e = excess travel (no lead precision required)
- l_o = nominal travel
- l_s = specified travel
- c = travel compensation (difference between l_s and l_o to be defined by the customer, for instance to compensate an expansion)
- e_p = tolerance over the specified travel
- V = travel variation (or permissible band width)
- V_{300p} = maximum permitted travel variation over 300 mm
- V_{up} = maximum permitted travel variation over the useful travel l_u
- V_{300a} = measured travel variation over 300 mm
- V_{ua} = measured travel variation over the useful travel

fig. 1

Case with value of c specified by the customer.

fig. 2

Case with $c = 0$ = standard version in case of no value given by the customer.

SD/BD miniature screws

Standard

Recirculation

Customised

Smooth running and excellent backdriving with the new SD/BD internal recirculation nut.

- Nominal diameter
8 to 16 mm
- Lead: 2 to 5 mm
- Cylindrical nut with threaded end: easy mounting
- Excellent repeatability:
high positioning quality
- Internal recirculation with inserts: smooth running and good backdriving
- Backlash elimination by oversize balls on request (BD designation)
- Optional safety device (*):
12x4R - 14x4R - 16x5R
- Optional wipers (*):
For all sizes
- Corrosion resistant screw (see page 16)

(* It is not possible to supply safety device and wipers in the same nut.

- Backlash elimination by
oversize balls on request
(BDS designation)
- Optional wipers:
For all sizes
- For size 16x5R (SDS/BDS),
balls are in 100 Cr6

SH miniature screws

Standard

Recirculation

Customised

Rolled thread ball screw with ball recirculation by integrated tube.

- Nominal diameter 6 to 12,7 mm
- Lead: 2 to 12,7 mm
- Nut with threaded end for easy mounting
- High positioning accuracy
- Increased security: optional reinforced safety device available on request in size SH 12,7x12,7R
- Wipers available on request for size SH 12,7x12,7R

It is not possible to supply safety device and wipers in the same nut.

SX/BX universal screws

Standard

Recirculation

Customised

Rolled thread ball screw internal recirculation nut with threaded end.

Standard version: composite inserts

Special version: steel inserts which can act as a safety device for severe requirements or vertical applications
Contact us.

- Nominal diameter 20 to 63 mm
- Lead: 5 to 10 mm
- Cylindrical body of minimum diameter to simplify assembly
- Lubrication hole for nipple or automatic SKF system 24, positioned relative to the ISO thread
- Handling screw: nut with axial play
- Screw shaft can be phosphated on request
- Wipers available
- Backlash elimination by oversize balls on request (BX designation)
- Nut mounting flanges available
- Screw shaft accessories: FLBU - PLBU & BUF off the shelves. (see pages 40 to 45)

Preload

A displacement Δs is ground into the nut ball track between the two series of recirculation inserts: this displacement is made in an unused part of the track. The balls thus have two points of contact even under small external loads.

PN preloaded screws

Standard

Recirculation

Customised

Rolled thread ball screw with internal recirculation nut.

Standard version: composite inserts

Special version: steel inserts which can act as a safety device for severe requirements or vertical applications
Contact us.

- Nominal diameter 16 to 63 mm
- Lead: 5 to 10 mm
- Lubrication hole for nipple or automatic SKF system 24
- One-piece nut with integral flange offering an internal preload for optimum rigidity
- Wipers available
- Screw shaft can be phosphated on request
- Screw shaft accessories: FLBU - PLBU & BUF off the shelves (see pages 40 to 45)

Preload

A displacement Δs is ground into the nut ball track between the two series of recirculation inserts: this displacement is made in an unused part of the track. The balls thus have two points of contact even under small external loads.

SL/BL long lead screws

Standard

Recirculation

Customised

A new ball circulation system allowing high linear speed and low noise level.

- Nominal diameter 25 to 50 mm
- Lead: 20 to 50 mm
- Lubrication hole for nipple or automatic SKF system 24
- Two versions:
 - nut with axial play "SL"
 - nut with backlash elimination by oversize balls "BL"
- Double protection with polyamide wipers and brush wipers (WPR = with brush wipers NOWPR = without brush wipers)
- Screw shaft can be phosphated on request
- Screw shaft accessories: FLBU - PLBU & BUF off the shelves (see pages 40 to 45)

Designation: see page 49

Rotating nut

Concept

The nut rotates inside bearings and moves along the fixed long lead screw shaft.

The drive motor moves with the nut, so inertia & critical speed problems, associated with a long rotating shaft, are minimised.

Design details

- 72 series angular contact bearings are directly mounted on the nut.
- They are preloaded in “0” configuration in order to fully support the torque due to the belt tension.

- 2 Nilos seals protect these bearings against pollution and permit lubrication for life.
- Two versions available:
 - * Ball screw with axial play: SLT
 - * Ball screw with backlash elimination: BLT
- Two brush wipers are mounted in the standard configuration for better protection.
- Ball screw lubrication: through the nipple placed on the housing external diameter in the standard version, or as an option through the screw shaft.
- Ball nut greased with SKF LGMT2. Other lubricants possible on request.

Benefits

- Easy and simple to incorporate.
- Compact solution, ready to use.
- Fixed screw shaft: simplified mounting.
- Inertia considerably reduced: 3800 kgmm² instead of 6000 kgmm² for a screw shaft, 40x40 - 4.5 m stroke.
- Smaller, lighter, lower power motors.
- Higher linear speeds: up to 110 m/min.

Size	Ball screw capacities		Bearing axial capacities

Shaft end combinations

In the order code, shaft end machining is defined by:

- one letter for $\varnothing < 16$ mm
 - two letters for $\varnothing \geq 16$ mm
- resulting from the combination of two machined ends
(see designation page 49).

Machined ends are represented in details in
page 37 for $\varnothing < 16$ mm and
page 38 for $\varnothing \geq 16$ mm.

$\varnothing < 16$ mm		$\varnothing \geq 16$ mm

Standard end machining for nominal diameter ≥ 16 mm

Standard shaft ends for ball screws, nominal diameter ≥ 16 mm, have been developed to suit the SKF thrust bearings FLBU, PLBU and BUF.

These standard ends are the same for all screw types.

However, for the "SL/BL" long lead screw, an additional shoulder, part of the threaded length, will be machined to protect the wiper and nut thread during assembly (both sides).

Apart from this, the end itself is the same for all screw types.

Standard machined ends

Threaded length = total length - end length

(■) : end length

End bearings

Axially locating flanged housing with SKF angular contact ball bearings (back to back arrangement).

The “FLBU” flanged bearing unit consists of:

- precision housing, made of burnished steel ①
- two SKF preloaded angular contact ball bearings, 72 or 73 series ②
- two garter seals ③
- locknut, self-locking Nylstop type or, on demand, high precision KMT ④

The “FLBU” flanged thrust bearing unit provides the following benefits:

- lubrication for life.
- very easy mounting (matched bearings, hand mounting on the shaft end) as well as easy disassembly with the optional high precision KMT nut.

In standard version, the “FLBU” thrust bearing unit is assembled according to drawing page 41. If you require a different assembly, please indicate it when ordering.

End bearings

Fixed plummer housing with SKF angular contact ball bearings (back to back arrangement)

The “PLBU” plummer bearing unit consists of:

- precision housing, made of burnished steel, with precision reference edges on both sides ①
- two SKF preloaded angular contact ball bearings, 72 or 73 series ②
- two garter seals ③
- locknut, self-locking Nylstop type or, on demand, high precision KMT ④

The “PLBU” plummer bearing unit provides the following benefits:

- lubrication for life.
- very easy mounting (matched bearing, hand mounting on the shaft ends) as well as easy disassembly with the optional high precision KMT nut.
- good rigidity guaranteed by foot mounting with dowel pins.

Calculation formulas

1. Dynamic load rating (N) and Basic life rating

$$L_{10} = \left(\frac{C_a}{F_m} \right)^3 \text{ or } C_{req} = F_m (L_{10})^{1/3}_{req}$$

L_{10} = life (million of revolutions)
 C_a = basic dynamic load rating
 C_{req} = required dynamic load rating
 F_m = cubic mean load (N)

2. Cubic mean load (N)

$$F_m = \frac{(F_1^3 L_1 + F_2^3 L_2 + F_3^3 L_3 + \dots)^{1/3}}{(L_1 + L_2 + L_3 + \dots)^{1/3}}$$

$$F_m = \frac{F_{min} + 2F_{max}}{3}$$

3. Critical speed of screw shaft (no safety factor) (rpm)
 (a factor of 0,8 is generally recommended)

$$n_{cr} = 490 \cdot 10^5 \cdot \frac{f_1 d_2}{l^2}$$

d_2 = root diameter (mm)
 l = free length, or distance between the two support bearings (see page 6)
 f_1 = 0,9 ●●— fixed, free
 3,8 ●●—● fixed, supported
 5,6 ●●—●● fixed, fixed

4. Speed limit of the mechanism (maxi speed applied through very short periods)

For instance :
 $n \times d_0 < 50\ 000$
 with recirculation by tubes/inserts (SH-SD/BD-SX/BX-SN/BN/PN-SND/BND/PND)
 $n \times d_0 < 90\ 000$
 with recirculation through flange (SL/BL-SLD/BLD)
 if $> 50\ 000/90\ 000$, consult SKF

n = revolutions per minute
 d_0 = screw shaft nominal diameter

5. Buckling strength (with a safety factor: 3) (N)

$$F_c = \frac{34\ 000 \cdot f_3 \cdot d_2^4}{l^2}$$

d_2 = root diameter (mm)
 l = free length, or distance between the two support bearings
 f_3 = mounting correction factor
 0,25 ●●— fixed, free
 1 ●—● supported, supported
 2 ●●—● fixed, supported
 4 ●●—●● fixed, fixed

Calculation formulas

6. Theoretical efficiency

- direct (η)

$$\eta = \frac{1}{1 + \frac{K \cdot d_0}{P_h}}$$

- K = 0,02 for SH
- K = 0,018 for SD, SX, SL, SN, SND, BD, BX, BN, BL, PN, PND
- d_0 = nominal diameter of screw shaft
- P_h = lead (mm)

- indirect (η')

$$\eta' = 2 - \frac{1}{\eta}$$

7. Practical efficiency (η_p)

$$\eta_p = \eta \cdot 0,9$$

The value 0,9 used is an average value between the practical efficiency of a new screw and that of a properly run in screw. It should be used for industrial applications in all normal working conditions. For extreme cases, call us.

8. Input torque in a steady state (Nm)

$$T = \frac{F \cdot P_h}{2000 \cdot \pi \cdot \eta_p}$$

- F = maximum load of the cycle (N)
- P_h = lead (mm)
- η_p = practical efficiency

9. Power required in a steady state (W)

$$P = \frac{F \cdot n \cdot P_h}{60000 \cdot \eta_p}$$

- n = revolutions per minute

10. Preload torque (Nm)

$$T_{pr} = \frac{F_{pr} \cdot P_h}{1000 \cdot \pi} \left(\frac{1}{\eta_p} - 1 \right)$$

- F_{pr} = preload (N)

Calculation formulas

11. Restraining torque
(Nm)
(considering system backdriving)

$$T_B = \frac{F \cdot P_h \cdot \eta'}{2000 \cdot \pi}$$

F = load (N)
For safety, we can use the theoretical indirect efficiency
 η' = indirect efficiency

12. Nominal motor torque when accelerating
(Nm)

For a horizontal screw

$$T_t = T_f + T_{pr} + \frac{P_h [F + m_L \cdot \mu_f \cdot g]}{2000 \cdot \pi \cdot \eta_p} + \dot{\omega} \Sigma I$$

For a vertical screw

$$T_t = T_f + T_{pr} + \frac{P_h [F + m_L \cdot g]}{2000 \cdot \pi \cdot \eta_p} + \dot{\omega} \Sigma I$$

T_f = torque from friction in support bearings, motors, seals, etc... (Nm)

T_{pr} = preload torque

μ_f = coefficient of friction

η_p = real direct efficiency

$\dot{\omega}$ = angular acceleration (rad/s²)

m_L = mass of the load (kg)

g = acceleration of gravity (9,8 m/s²)

$\Sigma I = I_M + I_L + I_S \cdot l \cdot 10^{-9}$

13. Nominal braking torque when decelerating
(Nm)

For a horizontal screw

$$T_t = T_f + T_{pr} + \frac{P_h \cdot \eta' [F + m_L \cdot \mu_f \cdot g]}{2000 \cdot \pi} + \dot{\omega} \Sigma I$$

For a vertical screw

$$T_t = T_f + T_{pr} + \frac{P_h \cdot \eta' [F + m_L \cdot g]}{2000 \cdot \pi} + \dot{\omega} \Sigma I$$

$$I_L = m_L \left(\frac{P_h}{2\pi} \right)^2 10^{-6}$$

η' = theoretical indirect efficiency

I_M = inertia of motor (kgm²)

I_S = inertia of screw shaft per metre (kgmm²/m)

l = length of screw shaft (mm)

For additional information, please contact SKF

Nominal diameter x Lead

Hand

R = Right L = Left (on request)

Threaded length / Total length, mm

Lead precision: G9, G7, G5

Nut orientation

Threaded side or flange of nut towards shorter (S) or longer (L) machined end of shaft. In case of same end machining : (-)

Machined end combination

See page 36

Required lengths for: AA - SA (both side)

See page 36

WPR: with wipers • NOWPR: without • RING: safety ring (for SH-SD only)

REDPLAY :

Reduced axial play

The robust screws for long life in tough conditions.

\emptyset = 8 to 210 mm
Ph = 4 to 42 mm

- * high load carrying capacity
- * ability to survive occasional blows and shock loads
- * highly reliable, even in hostile surroundings and at high rotational speed.

Planetary roller screws

Recirculating roller screws

The fine screws for ultimate positioning accuracy.

\emptyset = 8 to 125 mm
Ph = 1 to 5 mm

- * fine resolution
- * high rigidity

Electro-mechanical cylinders

They are designed for long life, high acceleration and high force applications. The cylinders use brushless servomotor technology, with an in-line direct drive as standard. SKF high performance electro-mechanical cylinders using planetary roller screws are expanding the limits of linear actuators.

The high performance Electro-Mechanical cylinders consist of an SKF planetary roller screw directly driven through a coupling by a brushless motor.

The roller screw converts rotary motion into linear movement.

The new standard for high performance motion

Compact Electro-Mechanical cylinders (CEMC) are designed to deliver the combination of a dynamic flexible actuation packaged with powerful performance.

Cylinders for heavy loads

High loads and heavy working cycles: long life in adverse environments such as in steel industry.
