### General Description

The TS2596 Series are step-down switching regulators with all required active functions. It is capable of driving 3A load with excellent line and load regulations. These devices are available in fixed output voltages of 3.3V, 5V, and an adjustable output version.

The TS2596 series operates at a switching frequency of 150kHz thus allowing smaller sized filter components than what would be needed with lower frequency switching regulators. It substantially not only reduces the area of board size but also the size of heat sink, and in some cases no heat sink is required. The  $\pm 4\%$  tolerance on output voltage within specified input voltages and output load conditions is guaranteed. Also, the oscillator frequency accuracy is within  $\pm 10\%$ . External shutdown is included. Featuring 70 $\mu$ A (typical) standby current. The output switch includes cycle-by-cycle current limiting, as well as thermal shutdown for full protection under fault conditions.

This series are offered in 5-pin TO-263, TO-220 package.

Note 1: External components such as the catch diode, inductor, input and output capacitors can affect switching regulator system performance. Refer to Application information for details.

Note 2: The oscillator frequency reduces when the second stage current limit is activated. The amount of reduction is determined by the severity of current over load.

Note 3: For these parameters, FB is removed from V<sub>OUT</sub> and connected to +12V to force the output transistor OFF.

Note 4: V<sub>OUT</sub> pin sourcing current. No diode, inductor or capacitor connected to V<sub>OUT</sub>.

Note 5: FB is removed from V<sub>OUT</sub> and connected to 0V.
