LED-driver in DC-design (DC converter)

The LED-*driver*-35/ -70 DC 24 are switchable devices with dimming function which are used for the power supply of Power LEDs with nominal currents of 350/700 mA..

The DC converter has an input voltage range of DC 12-30 V and supplies a maximum output of Uout=0,8 x Uin.

Two types of devices suitable for dimming are available:

• control input 1-10 V DC:

The brightness control of the LEDs works with the an integrated PWM module with a 1-10V control input. These control inputs may alternatively be operated with an electronic potentiometer (1-10 V), a conventional potentiometer or a DC control voltage 1-10 V.

• control input external PWM signal (rectangle):

The brightness control works by feeding an external rectangular PWM signal (40 Hz...10 KHz, 3,5...10 V) to the control input +Ust.

The LED-driver in DC design (12-30V) is available both as housing device (closed with connecting leads) and as open-frame assembly (PCB version) (see range of products and order data).

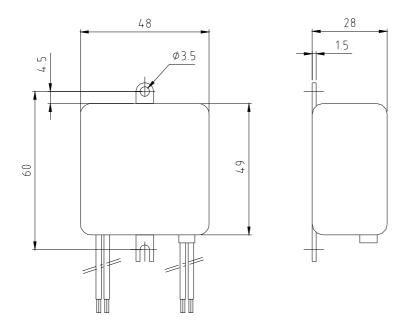

The connection is made either via 4 lines or with clamps on the PCB.
